

1. Martin Brechbiel's Double End Tank Motor

This is an O scale double end tank motor that was scratchbuilt upon a generic flat

blank that I cast in resin. Ends are wood with working doors and interior controls in place. Tank is plastic conduit tubing with brass parts (dome & ends) anchored in place by the bands through the floor. There's a full underbody installed of Q-car and Wagner detail parts, and this is powered by a Q-car power truck with two Magic Carpet drives all wired for 8-wheel track pick-up. This could also be modified for overhead wire power as well. Lots of good fun working in resin, brass, styrene, and of course, wood!

Martin Brechbiel, MMR
